

Easy Booking

Overview

This project is a hotel search application similar to booking.com that provides dynamic autocomplete functionality. As the user types into various form fields, suggestions are retrieved from a PHP backend and displayed using jQuery UI Autocomplete.

The system enhances user experience by quickly suggesting relevant entries such as cities, hotel names, customer names, email addresses, and room types.

Features

- Live autocomplete suggestions
- jQuery UI Autocomplete frontend
- PHP-based backend providing JSON responses
- AJAX requests for fast interaction
- Multiple searchable fields:
 - City
 - Hotel Name
 - Customer Name
 - Email
 - Room Type

Technologies Used

Frontend

- HTML5
- JavaScript
- jQuery 3.6+
- jQuery UI 1.13+

Backend

- PHP 7+
- JSON output

Server

- Apache Web Server

File Structure

project/

```
|
|
|—— public/
|
|   |—— index.html
|   |—— autocomplete.js
|   |—— jquery UI resources (via CDN)
|
|
|—— backend/
|
|   |—— autocomplete_api.php
```

How It Works

1. The user types into one of the input fields.
2. JavaScript sends an AJAX request to the backend API:
3. GET autocomplete_api.php?term=<keyword>&field=<field_name>
4. The backend filters and returns matching results in JSON format.
5. jQuery UI Autocomplete displays the suggestions beneath the field.

Sample API Request

GET autocomplete_api.php?term=rom&field=city

Sample Response

```
[
  "Rome",
  "Romantic Suites",
  "Rome Grand Hotel"
]
```
